

Contents

Dedication	iii
Foreword	iv
Preface	v
About the authors	vi
Acknowledgements	vii
Acronyms	viii
Glossary	x
Contents	xvii
1. Introduction	1
1.1 Background	1
1.2 Disciplinary contributions to flotation optimisation	2
1.3 Identifying and quantifying the performance opportunity	3
1.4 Demonstrating and proving the performance opportunity	7
1.5 Structure of the book	8
2. Process mineralogy	10
2.1 Concept and purpose	10
2.2 Quantitative mineralogy	10
A. Case study 1: Magmatic Ni-Cu-PGE sulphide ores	12
B. Case study 2: Hypogene and supergene copper ores	15
2.3 Understanding mineral grades and element deportment	17
2.4 Representing mineral grades and element deportment	19
2.5 Understanding mineral texture	24
2.6 Representing mineral texture	27
2.7 Summary	33
3. Sampling	34
3.1 Concept and purpose	34
3.2 Terms and definitions	34
3.3 Geometallurgical units	34

3.4	Sampling correctness and representativeness	36
3.5	How much material to extract	36
	C. Worked example 1: The minimum sample mass model	38
3.6	How the sample is taken	39
	3.6.1 Sample extraction rules	39
	3.6.2 Timing of the sample increments – The semivariogram	40
	D. Worked example 2: The semivariogram	42
3.7	How the sample is treated and subsampled	43
	3.7.1 The safety line	44
	3.7.2 Subsampling and the spinning riffler	45
3.8	Summary	47
4.	Minerals as semiconductors	48
	4.1 Concept and purpose	48
	4.2 Semiconductor minerals	48
	4.3 Doping	49
	4.4 p-Type semiconductor	50
	4.5 n-Type semiconductor	50
	4.6 Reactivity	51
	4.7 Variation in semiconductivity within the Cu-Fe-S systems	52
	4.8 Summary	55
5.	Flotation electrochemistry	56
	5.1 Concept and purpose	56
	5.2 Mineral oxidation in the pulp	56
	5.3 Galvanic interactions	57
	5.4 Collector oxidation and potential dependence of hydrophobicity	59
	5.5 Rest potential and mineral species prediction	61
	5.6 Measurement of potentials in the pulp phase (Eh measurement)	62
	5.7 Application of potential control	64
	5.7.1 Controlled potential sulphidisation	64
	5.7.2 Rejection of penalty elements	66
	5.8 Pourbaix diagrams	67
	5.9 Context of Pourbaix diagrams in flotation	68
	5.10 Summary	70

6.	Grinding strategies	71
6.1	Concept and purpose	71
6.2	Physical grinding duty – Milling rate and grind size.....	72
6.3	The JKSimMet approach to sizing AG/SAG mills	75
6.3.1	The JKDrop Weight sizing method for AG/SAG mills	76
6.3.2	The JKRotary Breakage Tester	78
6.4	Morrell’s power-based approach.....	79
6.5	The SAGDesign sizing method.....	82
6.6	Bond work index – Secondary milling.....	85
6.7	Grinding ball size	86
6.8	Sizing the mill shells	87
6.9	Stirred milling sizing- Signature plot approach	88
6.10	Classification.....	89
6.11	Modelling the liberation size.....	92
6.12	Grinding media and pulp potential.....	93
6.13	Summary.....	95
7.	Flotation reagents.....	97
7.1	Concept and purpose	97
7.2	Collectors.....	98
7.2.1	Xanthates.....	98
7.2.2	Dithiocarbamates	99
7.2.3	Dithiophosphates	99
7.2.4	Ranking of three collector types.....	100
7.2.5	Formulation and use of mixed collectors	100
E.	Worked example 3: Mixed collectors at Eland Platinum, South Africa	102
7.3	Activators.....	106
7.4	Frothers.....	107
7.4.1	Alcohols	108
7.4.2	Polyglycols.....	109
7.4.3	Optimum frother dosage	110
7.5	Depressants	112
7.6	Water quality.....	114
7.7	Summary.....	115

8.	Quality control statistics.....	116
8.1	Concept and purpose	116
8.2	The normal and lognormal distributions.....	116
8.2.1	Normal distribution.....	117
8.2.2	Lognormal distribution	117
8.3	Outlier detection in replicate data	118
F.	Worked example 4: Replicate flotation tests.....	119
8.4	Central limit theorem – The averaging process	120
8.5	Calculating the size of the data set	121
G.	Worked example 5: Calculating the size of the data set	122
8.6	Small and large data sets – What’s the difference?	123
8.7	Summary.....	124
9.	Laboratory-scale flotation testing	125
9.1	Concept and purpose	125
9.2	Errors and mistakes in quality control flotation testing.....	126
9.3	Microflotation testing.....	126
9.4	Batch flotation testing.....	128
9.4.1	Assayed head grade	129
9.4.2	Theoretical (built-up) head grade	129
H.	Worked example 6: Sampled and built-up head data	131
9.4.3	Singleton flotation test	133
9.4.4	Replicate flotation tests.....	133
9.4.5	Number of replicate flotation tests	136
9.4.6	Locked cycle tests.....	137
9.5	The mini-pilot plant (MPP).....	138
9.6	Identification and treatment of flotation hierarchies	139
9.7	Summary.....	141
10.	Plant-scale trials.....	142
10.1	Concept and purpose	142
10.2	The value of designed plant-scale trials.....	142
10.3	Plant trials within autocorrelation - The paired t-distribution.....	143
10.4	Plant trials outside autocorrelation - The analysis of variance (ANOVA)	146

I.	Worked example 7: A mixed collector for Eland Platinum Mine, South Africa.....	147
10.5	Layout of the plant trial	149
J.	Worked example 8: Medium-term data set at Raglan Concentrator, Canada	150
K.	Worked example 9: Short-term data set at No. 1 Concentrator, Canada	151
10.6	Summary.....	155
References.....		156
Appendix.....		167
Appendix 1 – Table of critical values of the t-distrib. at the 95 and 99% confidence level.....		167
Appendix 2 – Table of critical values of the F-distrib. at the 95% confidence level		168
